

## Device Enables Shared Card Readers

*Athol, MA – October 8<sup>th</sup>, 2015* - Current Concept DesignWorks expanded its popular ReaderRouter™ product family, adding more solutions to allow sharing of card readers between multiple access control systems. Typical applications include perimeter access, elevators and shared common areas.

Swipes are routed to different controllers by card number, by facility code or by format. Dealer can define routing rules and upload on- or off-site.

The product line includes new router and multiplexer models. Both are available as a 2-in/8-out or 2-in/4-out configuration. The product line expansion was developed to allow lower cost for simpler configurations. The original ReaderRouter™ has been in service since 2008.
